In the claims:

Please substitute the following full listing of claims for the claims as originally filed or most recently amended.

1. (Currently amended) A folding type portable communication device, comprising:

two communication units connected to each other in a foldable manner and having a folded position and an unfolded position;

a two-level switch for detecting which one of the folded and unfolded position the two communication units have, the switch providing a first level when the two communication units have the folded position and a second level when the two communication units have the unfolded position;

- a vibrator;
- a sounder;

a mode selector operatively coupled with the twolevel switch, the vibrator and the sounder for selectively providing setting for one of a calling reception vibration mode and a sound mode in response to the level provided by the two-level switch,

the mode selector including a first circuit for driving the vibrator when energized and a second circuit for driving the sounder when energized;

the mode selector including a controller for energizing the first circuit upon reception of a calling when the setting for the calling reception vibration mode is provided and the second circuit upon reception of a calling when the setting for the calling reception sound mode is provided.

2. (Currently amended) A folding type portable communication device as claimed in claim 1, wherein the controller energizes the first circuit upon reception of a calling when the two-level switch provides the

first level indicating that the two communication units have the folded position, and where the controller energizes the second controller circuit upon reception of a calling when the two-level switch provides the second level indicating that the two communication units have the unfolded position.

- 3. (Currently amended) A folding type portable communication device as claimed in claim 1, wherein the controller energizes the first circuit upon reception of a calling when the two-level switch provides the second level indicating that the two communication units have the unfolded position, and where the controller energizes the second controller circuit upon reception of a calling when the two-level switch provides the first level indicating that the two communication units have the folded position.
- 4. (Currently amended) A folding type portable communication device as claimed in claim 1, wherein the mode selector includes a memory coupled with the controller, and wherein the memory stores the settings for the calling reception vibration mode and calling reception sound mode.
- 5. (Original) A folding type portable communication device as claimed in claim 1, wherein the two-level switch includes a magnet mounted within one of the two communication units and a detector mounted within the other communication unit for detecting a magnetic field provided by the magnet.
- 6. (Original) A folding type portable communication device as claimed in claim 5, wherein the magnet is brought into registry with the detector when the two communication units have the folded position.

7. (Currently amended) A method of controlling a selection between a calling reception vibration mode and a calling reception sound mode of a folding type portable communication device that has two communication units connected to each other in a foldable manner and having a folded position and an unfolded position, the method comprising;

detecting which one of the folded and unfolded position the two communication units have;

providing setting for the calling reception vibration mode upon detecting the folded position; and

providing setting for the calling reception sound mode upon detecting the unfolded position.
